General Safety Practices

Do not touch or tamper with the power supply when the power cord is connected. Line voltages may be present even when the product is powered off or a fuse is blown.

Before working on equipment connected to power lines or to other devices, remove jewelry or any other metallic object that may come into contact with energized parts.

The product is intended to be grounded during normal use. Grounding is provided by connecting the mains plug to a wall socket with a protective earth terminal. The earth lug provided on the product should be connected to the protective earth at all times, by a wire with a diameter of 18 AWG or wider.

Always make the ground connection first and disconnect it last. Do not connect data cables to ungrounded equipment. Make sure that all other cables are disconnected before disconnecting the ground.

Special Safety Warnings

Welding on or in the vicinity of the equipment is strictly prohibited.

Use reliable lightening conductors to prevent static loads caused by thunderstorms.

Connection of AC Mains

Make sure that the electrical installation complies with local codes. Always connect the AC plug to a wall socket with a protective ground.

The maximum permissible current capability of the branch distribution circuit that supplies power to the product is 16A. The circuit breaker in the building installation should have high breaking capacity and must operate at short-circuit current exceeding 35A.

Always connect the power cord first to the equipment and then to the wall socket. If the power cord cannot be readily disconnected in case of emergency, make sure that a readily accessible circuit breaker or emergency switch is installed in the building.

1 Introduction

VT200/220 is an industrial weight indicator, which connects to either one or two scales and allows you to:

- Tare a scale (see chapter 3)
- View an item's weight (see chapter 4)
- Count large numbers of items (see chapter 5)
- Print measurements in several different formats (see chapter 6)
- Save measurements in alibi memory and recall them later (see chapter 7)
- Define thresholds for two analog setpoints (see chapter 8)

The indicator can display weight for items of any size or weight, depending on the capacity of your scale.

Before starting to operate the VT200/220, make sure it has been connected to the mains, connected to at least one working scale, calibrated and properly set up. These operations should only be carried out by an authorized technician. For information see the *VT200/220 Technical Manual*.

1.1 How it Works

A weight indicator is a central component of an industrial weighing system. It receives weight information from a scale; interprets this information, manipulates it and displays it; and can then pass it on to peripheral devices, most commonly printers or personal computers.

1.1.1 Receiving Input from a Scale

A scale is designed to send out an electrical signal when weight is applied to its weighing platform. The heavier the item being weighed, the stronger the signal. An indicator like VT200/220 receives this signal and uses it to calculate the weight of the item. To do this, it must be connected to the scale and properly calibrated.

Calibration, which may only be performed by authorized technicians, tells the indicator the minimum and maximum weight the scale can handle, and the corresponding electrical signal for each of these extremes. This allows the indicator to translate an electrical measurement into actual weight in kilograms or pounds.

1.1.2 Displaying and Manipulating Weight Information

The basic operation of VT200/220 is to display the weight of the item that is currently on the platform. This information can be saved to a non-volatile memory called *Alibi Memory*, and retrieved later.

If you provide more information, VT200/220 can do more than just display the current weight. It can deduct the weight of the container (taring); calculate the number of units being weighed; and calculate an average weight for the units being weighed.

1.1.3 Sending Output to Other Devices

In addition to showing and manipulating weight information, VT200/220 can send it to other devices using its two serial ports. In a typical setup, the indicator is connected to a printer, allowing you to print out weight information in several formats.

It is also possible to connect the indicator to a personal computer, which allows more powerful data processing, or to an external display, which allows weight information to be viewed in a larger format or at a distance from the indicator itself.

VT200/220 also has two setpoints, with corresponding weight thresholds. When the item being weighed exceeds one of these thresholds, the relevant setpoint can trigger an event in your production process.

Only authorized technicians may connect the indicator to external devices such as the ones listed above.

1.2 Product Features

- High-accuracy analogue to digital converter (max 550,000 internal counts).

2 Using the Display and Keys

The VT200/220 front panel can be divided into three areas:

- A six-digit display (LED for VT200, LCD for VT220) that shows weight information, status information, and the names of menus and functions.
- A keypad with eight keys, allows you to turn the unit on and off, perform the most common functions, and access a function menu with more advanced options.
- The lower area shows information about the maker, model and certified limits of your indicator.

2.1 Understanding the VT200/220 Display

VT200 has an LED display, while VT220 model has an LCD display. Both models have six digits, which are used mainly to display weight information.

To the bottom and right of the digits, small dots may appear next to distinctly-shaped *status annunciators*. These dots provide status information, such as whether the scale has been tared or not.

2.1.1 Status Annunciators

At the bottom and right of the display are several status annunciators. A dot or a light shows up next to these to indicate the current status of the scale or indicator. Status annunciators are often important to understand what is being shown on the display.

	Stable	Active – the scale is stable (necessary for ZERO , TARE and PRINT). Inactive – the scale is not stable.
	Center of Zero	Active – the current weight is at center of zero. Inactive – the scale is above or below center of zero.
	Tared	Active – the preset tare value is now being displayed on the screen.
	Net Weight	Active – the display is showing net weight. Inactive – the display is showing gross weight.

Using the Display and Keys

Understanding the VT200/220 Display

3 Zeroing and Taring

The VT200/220 allows you to adjust the scale by zeroing or taring.

- Zeroing adjusts the center of zero to match the current environmental conditions.
- Taring compensates for the weight of an item's container, by subtracting it from the weight measured.

3.1 Manual Zeroing

You only need to manually zero the scale if the display consistently shows a figure lower or higher than zero. This can happen, for example, when mud or other debris collects on the weighing platform. As long as this debris remains in place for the duration of the weighing session, you can zero the scale to compensate for it.

Zeroing only works if the current weight is within zero range (as defined during calibration).

➔ **To manually zero the scale:**

1. Clear the scale, wait for it to become stable (the  status annunciator becomes active), and check the weight.
 - If the weight is in the zero range, proceed to step 2.
 - If the weight is outside the zero range, no error is shown, but manual zero will not work. Try to reduce (or increase) the pressure on the scale.
 - If  is active, i.e. the scale is at center of zero, there is no need to zero it.
2. Press **ZERO** (). The current weight is set as the center of zero. The display shows **ZEro** briefly, and  becomes active.

3.2 Taring

You can tare the scale by taking a measurement of an item's empty container. This weight is then subtracted from the weight measured by the scale, to arrive at a net weight that is shown on the display. This is called *Net Mode*. You can exit Net Mode to go back to viewing gross weight.

If you know the weight of the container, you can tare the scale by entering this weight directly (see chapter 3.3 below).

➔ **To tare the scale using the current weight:**

1. Check if the  status annunciator is active.
 - If the NET status annunciator is active, you are already in Net Mode. If you want to exit Net Mode and tare the scale again using a different weight, press **TARE** () , then proceed to step 2.
 - If the NET status annunciator is not active, proceed directly to step 2.
2. Tare the scale. Wait for the scale to become stable ( becomes active).
3. Press **TARE** () .  becomes active.
4. Fill the empty container, or replace it with a full one.
 - If you are in Weighing Mode, the display shows the net weight of the item or items, excluding the weight of the container.
 - If you are in Counting Mode, the display shows the number of units derived from the net weight.
5. To return to Gross Weighing Mode, press **TARE** () to exit Net Mode. The display shows gross weight, or number of units derived from the gross weight.

3.3 Preset Tare

If you know the weight of the container you intend to place on the scale, you can tare by entering this weight directly. It is then subtracted from the weight measured by the scale, to arrive at a net weight which is shown on the display. This is called *Net Mode*. You can exit Net Mode to go back to viewing gross weight.

If you do not know the weight of the container, you can tare the scale by weighing it empty (see chapter 3.2 above).

➔ **To tare the scale by entering the current weight:**

1. Check if the  status annunciator is active.
 - If the NET status annunciator is active, you are already in Net Mode. If you want to exit Net Mode and tare the scale again using a different weight, press **TARE** () , then proceed to step 2.
 - If the NET status annunciator is not active, proceed directly to step 2.
2. Press **P.TARE** () . Flashing 00.0000 will be displayed.
3. Enter the weight of the container and press **↵(PRINT)** .  becomes active.

4. Place a full container on the scale.
 - If you are in Weighing Mode, the display shows the net weight of the item or items, excluding the weight of the container.
 - If you are in Counting Mode, the display shows the number of units derived from the net weight.
5. To return to Gross Weighing Mode, press **TARE** (). The display shows gross weight, or number of units derived from the gross weight.

3.4 Viewing Preset Tare Value

➔ To view the current preset tare:

Press **P.TARE** (). The preset tare value is displayed briefly.

4 Measuring Weight

VT200/220 can:

- Display the weight of the item on the weighing platform (see chapter 4.1 below).
- Display an item's weight in high resolution – ten times the precision certified for your scale (see chapter 4.2 below).
- Add the current weight measurement to an accumulated total (see chapter 4.3 below).

VT200/220 shows gross weight by default. If you need to see net weight – excluding the container of the items being weighed – tare the scale before weighing.

4.1 Weighing an Item

➔ **To weigh an item:**

1. If the item you want to weigh is stored in a container, and you need to see its net weight, tare the scale (refer to chapter 3.2 if you don't know the weight of the container).
2. Place the item on the scale, and wait for it to become stable (the  status annunciator becomes active). The display shows the weight of the item.
3. To print the current measurement, or output it to a PC using the currently-selected print format, press **PRINT** (.

4.2 High Resolution Weighing

You can temporarily increase the resolution of the weight display by a factor of ten, so that the indicator shows an additional digit on the right. High resolution weighing is accessed through the function menu (function 06).

This high-resolution weight measurement is for your reference only. You cannot print it or use it for any legal transaction. To remind you of this, the weight display flashes when it is showing weight in high resolution.

➔ **To weigh an item with high resolution:**

1. Press **TARE** () on the front panel, and keep it pressed for around three seconds. The display shows **F_n 00**. The left zero flashes.
2. High resolution weighing is function 06, so there's no need to change the first digit. Press ➔ (**TARE**) to move to the second digit. It starts flashing.
3. Press ↑ (**P.TARE**) six times. The display should now show **F_n 06**.

4. Press \leftarrow (**PRINT**) to confirm.
5. Tare the scale (refer to chapter 3.2 if you don't know the weight of the container).
6. Place the item on the scale, and wait for it to become stable (the  status annunciator becomes active). The display shows the weight of the item.
7. The display now shows the weight of the item in high resolution (i.e. with one more digit on the right).

While high resolution weighing is on, the display flashes to remind you that you cannot use high-resolution measurements for printing or for any legal transaction.

8. When you are done weighing in high resolution, press **ZERO** () to return to normal weight resolution.

4.3 Accumulated Total Weight

Every time you print a weight measurement and/or output it to the PC, the gross weight is added to an accumulated total.

You can use the accumulated weight to check how much was weighed on the scale in total, over a certain period (for example, one work-day or one month). To do this, you should reset the total (set it to zero) at the start of the period. At the end of the period, you can view the total, print it and reset it again.

Printing and clearing is performed in one operation. When you print the total, the accumulated total is reset to zero.

Accumulated functionality is enabled and disabled using setup parameter 1.1 (1=enabled; 0=disabled).

4.3.1 Adding a Measurement to the Total

➔ To add an item's weight to the accumulated total:

1. Weigh the item normally (see chapter 4.1 above). Make sure the scale is stable
2. Press **PRINT** ()

4.3.2 Viewing the Total

➔ To view the accumulated total, or the total number of weighings:

1. Press **TOTAL** () . The display shows the sum of all accumulated weights. For example, if you clear the total and then measure three items weighing 100kg, 600kg and 300kg respectively, the display shows 1000.
2. Press **TOTAL** () again. The display shows the number of weights included in the current total. In the example above, the display would show 3.

Measuring Weight

Accumulated Total Weight

3. Press **TOTAL** () again to return to the normal weight display.

If you need to print the accumulated total, be aware that printing clears the totalizer memory. See the procedure below.

4.3.3 Printing and Resetting the Total

➔ To print the total and reset the total weight:

1. Press **TOTAL** (). The display shows the total weight, then the number of weights included in the total.
2. Press **PRINT** (). The total weight prints out and/or is output to the PC. The printout shows the current serial number and the total weight, as follows: 00003 0001.497kg. At the same time, the accumulated total is reset to zero.

5 Counting Units (Counting Mode)

VT200/220 can count the number of units (pieces) on the weighing platform. This is done by dividing the total weight by a unit weight. For example, you can place a bucket of screws weighing 5kg on the scale. Given that each screw weighs 5g, the indicator calculates that the bucket contains 1000 screws.

You can enter unit weight in one of two ways:

- By weighing a sample of units and entering the number of units.
- By entering a preset unit weight. This method is recommended if you know the unit weight, or if the units are very small.

You should only count units if they all have the same weight. The smallest unit weight is limited to 1 display division.

You can only access functions 51, 52 and 53 from Weighing Mode.

You cannot print from Counting Mode. Counting mode cannot be used as a reference for any legal transaction.

By default, Counting Mode uses the gross weight to count units. If your units are stored in a container, it is essential that you tare the scale. Otherwise the container will be counted as additional units, and the indicator will display an inflated number.

5.1 Counting Units

➔ To count units:

1. Set a unit weight for counting, either by weighing a sample (see chapter 5.2) or by entering a preset weight (see chapter 5.3).
2. Switch to Counting Mode if necessary, by pressing **PCS** (.
3. Place an unknown quantity of units on the scale, and wait for it to become stable. The display shows the number of units.

5.2 Using a Sample to Set Unit Weight

You can set a unit weight for counting by placing a sample of units on a scale (minimum 10 display divisions), and entering the number of units. The indicator calculates the average weight of the sample, and sets this weight as the unit weight for counting. This operation is accessed through the function menu (function 51).

If you need to see the average unit weight, use function 53 instead (refer to the second procedure below, 'To set unit weight using a sample and view average weight'). This function is the same as 51, except it displays the unit weight, and does not switch to Counting Mode automatically.

➔ **To set unit weight using a sample:**

1. If the sample is stored in a container, first tare the scale (refer to chapter 3.2).
2. Place the sample on the scale. It may not contain more than 99 units.
3. Press **TARE** () on the front panel, and keep it pressed for three seconds. The display shows **Fn 00**. The left zero flashes.
4. You need function 51, so press **↑ (P.TARE)** five times. The display should now show **Fn 50**.
5. Press **→ (TARE)** to move to the next digit. It starts flashing.
6. Press **↑ (P.TARE)** once. The display should now show **Fn 51**.
7. Press **↵ (PRINT)** to confirm. The display shows **xx**.
8. Enter the number of units in the sample. To do this, press **↑ (P.TARE)** to change the current digit, then **→ (TARE)** to move to the next digit. When you are done, press **↵ (PRINT)**.

The indicator calculates the average weight, sets it as the unit weight for counting, and switches from Weighing Mode to Counting Mode. The display should now show the number of units on the scale (the same number you entered earlier).

➔ **To set unit weight using a sample, and view average weight:**

1. If the sample is stored in a container, first tare the scale (refer to chapter 3.2).
2. Place the sample on the scale. It may not contain more than 99 units.
3. Press **TARE** () on the front panel, and keep it pressed for three seconds. The display shows **Fn 00**. The left zero flashes.
4. You need function 53, so press **↑ (P.TARE)** five times. The display should now show **Fn 50**.
5. Press **→ (TARE)** to move to the next digit. It starts flashing.
6. Press **↑ (P.TARE)** three times. The display should now show **Fn 53**.
7. Press **↵ (PRINT)** to confirm. The display shows **xx**.

8. Enter the number of units in the sample. To do this, press **↑ (P.TARE)** to change the current digit, then **→ (TARE)** to move to the next digit. When you are done, press **↵ (PRINT)**.
9. The average unit weight is shown on the display. Write down this weight if you need it. The indicator sets the weight displayed as the unit weight for counting.

5.3 Entering Unit Weight

You can enter a unit weight directly, instead of using a sample. This method is recommended if you know the unit weight (minimum 1 display division), or if the units are very small. This operation is accessed through the function menu (function 52).

➔ **To enter a preset unit weight:**

1. Press **TARE** () on the front panel, and keep it pressed for three seconds. The display shows **Fn 00**. The left zero flashes.
2. High resolution weighing is function 52, so press **↑ (P.TARE)** five times. The display should now show **Fn 50**.
3. Press **→ (TARE)** to move to the next digit. It starts flashing.
4. Press **↑ (P.TARE)** twice. The display should now show **Fn 52**.
5. Press **↵ (PRINT)** to confirm. The display shows **xxxxxx**.
6. Enter the unit weight. Note the position of the decimal point. To do this, press **↑ (P.TARE)** to change the current digit, then **→ (TARE)** to move to the next digit. When you are done, press **↵ (PRINT)**.

The preset weight you entered is set as the unit weight for counting, and the indicator automatically switches to Counting Mode.

6 Printing

The VT200/220 allows you to print the current weight measurement using a variety of print formats; print historic measurements; and download custom print formats from a host PC.

Printing is enabled and disabled using the setup parameter **2.t** (1=enabled; 0=disabled).

6.1 Printing the Current Measurement

➔ To print the current weight measurement to the printer:

1. Weigh the item normally (see chapter 4.1 above). Make sure the scale is stable.
2. Press **PRINT** (). The current measurement is printed to the printer using the current print format (see chapter 6.3 below for more on print formats).

When you print the current measurement, it is also sent to the host PC, if one is connected to the indicator (see chapter 7).

6.1.1 Repeating the Last Printing (Producing a Copy)

➔ To produce a copy of the last printout:

1. Press **TARE** () on the front panel, and keep it pressed for three seconds. The display shows **F_n 00**. The left zero flashes.
2. Printing a copy is function 43, so press **↑ (P.TARE)** four times. The display should now show **F_n 40**.
3. Press **→ (TARE)** to move to the next digit. It starts flashing.
4. Press **↑ (P.TARE)** three times. The display should now show **F_n 43**.
5. Press **←(PRINT)** to confirm. A copy of the last printout is printed.

When you print a copy, it is re-sent to the host PC, if one is connected to the indicator (see chapter 7).

6.2 Printing Historic Measurements from Alibi

All weight measurements you print are stored in the alibi memory of the indicator. This is a fixed memory unit that stores up to 10,000 records. Only gross weight measurements are stored in alibi memory.

You can access the alibi memory and print historic measurements by referencing their serial numbers. The serial number of a measurement appears on its printed ticket. Alternatively, you can print the entire alibi memory. These operations are accessed through the function menu (functions 55 and 56, respectively).

➔ To print ten consecutive alibi memory records:

1. Press **TARE** () on the front panel, and keep it pressed for three seconds. The display shows **Fn 00**. The left zero flashes.
2. Printing ten records is function 55, so press **↑ (P.TARE)** five times. The display should now show **Fn 50**.
3. Press **→ (TARE)** to move to the next digit. It starts flashing.
4. Press **↑ (P.TARE)** five times. The display should now show **Fn 55**.
5. Press **↵ (PRINT)** to confirm. The display shows **n1234**, where 1234 is the last record entered.
6. Try to find the serial number for the first of the 10 historic measurements you want to print. The serial number appears on the printed ticket.
7. Enter the serial number of the first measurement you want to print. By entering this serial number, you indicate that you want to print this measurement and the nine measurements that were performed immediately after it.

To do this, press **↑ (P.TARE)** to change the current digit, then **→ (TARE)** to move to the next digit. When you are done, press **↵ (PRINT)**.

8. Press **PRINT** () again to print ten alibi memory records, starting with the record you entered.

➔ To print the entire alibi memory:

1. Press **TARE** () on the front panel, and keep it pressed for around three seconds. The display shows **Fn 00**. The left zero flashes.
2. Printing all records is function 56, so press **↑ (P.TARE)** five times. The display should now show **Fn 50**.
3. Press **→ (TARE)** to move to the next digit. It starts flashing.
4. Press **↑ (P.TARE)** six times. The display should now show **Fn 56**.

Before proceeding, make sure the printer has enough paper. The alibi memory may contain thousands of records, and you are about to print them all. However, you can stop the printing at any time.

Printing

Print Formats

5. Press **←(PRINT)** to confirm. The printer starts printing the entire alibi memory, starting with the first measurement ever performed with this indicator. The printout format is as follows: SN 1234 123.456kg.
6. Press **ZERO** () to stop the printing prematurely (i.e. before it reaches the last record stored in alibi memory).

6.3 Print Formats

The VT200/220 offers several formats for printing weight measurements. Each format corresponds to a menu function, which you must activate to select it (see chapter 6.4 below). The following table shows each format with its name and function number.

In addition to the print formats shown below, there are two custom print formats, activated by functions 41 and 42. For more information, see *VT200/220 Technical Manual*.

6.4 Selecting a Print Format

You can select one of the VT200/220's standard print formats using the function menu (functions 21 through 30). It is also possible to download one of two custom print formats (using functions 41 and 42).

6.4.1 Standard Print Formats

VT200/220 supports ten standard print formats. Each print format corresponds to a function on the function menu. A table showing all the print formats, with their function numbers, appears in chapter 6.3 above.

At any given time, the indicator has a *current print format*. By default, this is Ticket (function 21). Each time you press **PRINT** () , the printout takes the shape of the current print format. You can change the current print format to any of the ten available formats using the procedure below.

In addition to the print formats shown below, there are two custom print formats, activated by functions 41 and 42. For more information, see *VT200/220 Technical Manual*.

➔ To change the current print format:

1. Check the menu function number that corresponds to the print format you need. Refer to the table in chapter 6.3.
2. Press **TARE** () on the front panel, and keep it pressed for three seconds. The display shows **Fn 00**. The left zero flashes.
3. Press **↑ (P.TARE)** to increment the left-hand digit (tens). Keep pressing it until it matches the function you need.
4. Press **→ (TARE)** to move to the right-hand digit (units). This digit should start flashing.
5. Press **↑ (P.TARE)** to increment the right-hand digit (units). Keep pressing it until it matches the function you need.
6. Make sure the function number you entered matches the print format you need.
7. Press **↵ (PRINT)** to confirm. The print format you wanted is now set as the current print format. Each time you press **PRINT**, the printout will be in this format.

6.5 Disabling Print Output

You have the option of temporarily disabling print output. This can be useful if you want to output measurements to the PC, or add them to the accumulated total (see chapter 4.3), without printing them out. Normally all these operations are performed when you press **PRINT** (.

➔ **To disable print output:**

1. Press **TARE** () on the front panel, and keep it pressed for around three seconds. The display shows **Fn 00**. The left zero flashes.
2. Disabling print output is function 20, so press **↑ (P.TARE)** twice. The display should now show **Fn 20**.
3. Press **↵ (PRINT)** to confirm. Print output is now disabled until another print format is set.

By performing this operation, you effectively change the current print format to "disabled."

➔ **To turn print output on again:**

Use the function menu to switch to the print format you need (functions 21 through 30). Refer to chapter 6.4 above for instructions.

7 Alibi Memory Functions

All weight measurements you print are stored in the alibi memory of the indicator. This is a fixed memory unit that stores up to 10,000 records. Only gross weight measurements are stored in alibi memory.

You can perform the following actions on the alibi memory:

- View or print historic measurements by referencing their serial numbers (function 55 in the function menu). The serial number of a measurement appears on its printed ticket.
- Print the entire alibi memory (function 56 in the function menu).
- Check the alibi memory for errors (function 57 in the function menu).

7.1 Viewing/Printing Specific Records

The same function menu operation (function 55) allows you to view a single historic record on the indicator screen, and, optionally, print it and the next nine records on the printer.

➔ **To view and (optionally) print alibi memory records:**

1. Press **TARE** () on the front panel, and keep it pressed for around three seconds. The display shows **Fn 00**. The left zero flashes.
2. Viewing/printing records is function 55, so press **↑ (P.TARE)** five times. The display should now show **Fn 50**.
3. Press **→ (TARE)** to move to the next digit. It starts flashing.
4. Press **↑ (P.TARE)** five times. The display should now show **Fn 55**.
5. Press **↵ (PRINT)** to confirm. The display shows **n1234**, where 1234 is the last record entered.
6. Try to find the serial number for the alibi memory record you want to view. If you plan to print records, this will also be the first of the ten records that will be printed. The serial number appears on the printed ticket.
7. Enter the serial number. To do this, press **↑ (P.TARE)** to change the current digit, then **→ (TARE)** to move to the next digit. When you are done, press **↵ (PRINT)**.
8. The gross weight flashes on the display.
 - If all you need is this specific measurement, press **ZERO** ()
 - If you would like to print ten alibi records, starting with this one, proceed to the next step.
9. Press **PRINT** () again to print ten alibi memory records, starting with the record you entered.

7.2 Printing all Historic Measurements

➔ To print the entire alibi memory:

1. Press **TARE** () on the front panel, and keep it pressed for around three seconds. The display shows **Fn 00**. The left zero flashes.
2. Printing 10 records is function 56, so press **↑ (P.TARE)** five times. The display should now show **Fn 50**.
3. Press **→ (TARE)** to move to the next digit. It starts flashing.
4. Press **↑ (P.TARE)** six times. The display should now show **Fn 56**.

Before proceeding, make sure the printer has enough paper. The alibi memory may contain thousands of records, and you are about to print them all. However, you can stop the printing at any time.

5. Press **↵ (PRINT)** to confirm. The printer starts printing the entire alibi memory, starting with the first measurement ever performed with this indicator. Each line of the printout has the following format: **SN 1234 123.456kg**.
6. Press **ZERO** () to stop the printing prematurely (i.e. before it reaches the last record stored in alibi memory).

7.3 Checking Alibi Memory for Errors

The alibi memory is sometimes used to record legal transactions, so it is important to make sure that it is in working order.

This is done through the function menu (function 57), and works by performing a checksum on each alibi memory record to make sure it is not corrupted.

➔ To check the alibi memory for errors:

1. Press **TARE** () on the front panel, and keep it pressed for around three seconds. The display shows **Fn 00**. The left zero flashes.
2. Checking alibi memory is function 57, so press **↑ (P.TARE)** five times. The display should now show **Fn 50**.
3. Press **→ (TARE)** to move to the next digit. It starts flashing.
4. Press **↑ (P.TARE)** seven times. The display should now show **Fn 57**.
5. Press **↵ (PRINT)** to confirm. The indicator starts checking the alibi memory for errors. This can take a few minutes.
6. One of two messages are displayed:
 - **PASS**. This means all alibi records are okay.
 - **Err 57**. This means that at least one record is corrupted.

8 Setpoints and Digital Input

The VT200/220 can interface with weighing automation systems, using two opto-isolated outputs (digital setpoints) and one digital input. Only authorized technicians should connect the indicator to other systems in your production environment, using these outputs and inputs.

- The outputs (setpoints) are triggered when the scale reads an upper weight threshold, which you define. There is a separate threshold for each setpoint.
- The digital input is used as a tilt switch. When a signal is received on the input cable, the display locks for a certain period of time. The tilt switch is enabled, and its time delay defined, during setup.

8.1 Technical Specifications

8.1.1 Digital Outputs

- Transistor output open collector positive common.
- 24VDC + 10% /100mA per output.
- Max off: State voltage 30VDC / leakage 100 μ A.
- Optoisolated to 2.5 kV.
- Short-circuit protected.
- 2ms maximum delay for both on and off positions.

8.1.2 Digital Input (Tilt Switch)

- 9-24 VDC, positive common optoisolated to 2.5 KV.
- Input resistance 3.3 K Ω .
- 2ms maximum delay for both on and off positions.

8.2 Editing thresholds for setpoints

Each setpoint has an upper weight threshold that triggers it. For example, if you set a threshold of 13kg for setpoint 1, nothing will happen as long as the items on the scale weigh less than 13kg. As soon as an item is placed on the scale that weighs exactly 13kg, or more, the setpoint will be switched to on (if normally off) or to off (if normally on).

You can use the two setpoints to set an upper and lower range for a production operation. For example, if the weight of a product drops below the threshold for setpoint 1, or goes above the threshold for setpoint 2, it can be rejected.

Setpoints can be activated either by net weight value or by gross weight, depending on how this was defined in setup.

Setpoints can be either normally open or normally closed, depending on how this was defined in setup.

➔ **To edit weight thresholds for both setpoints:**

1. Press **TARE** () on the front panel, and keep it pressed for around three seconds. The display shows **Fn 00**. The left zero flashes.
2. Editing setpoints is function 01, so press ➔ (**TARE**) to move to the next digit. It starts flashing.
3. Press ↑ (**P.TARE**) once. The display should now show **Fn 01**.
4. Press ↵ (**PRINT**) to confirm. The display shows **SEtP 1** briefly. Then it shows the current threshold for setpoint 1. The extreme-left digit flashes.
 - If you don't want to change this threshold, press ↵ (**PRINT**) and skip to step 6.
 - If you do want to change it, proceed to step 5.
5. Enter a new threshold value. To do this, press ↑ (**P.TARE**) to change the current digit, then ➔ (**TARE**) to move to the next digit. When you are done, press ↵ (**PRINT**).
6. The display now shows **SEtP 2** briefly, then the current threshold for setpoint 2. The extreme-left digit flashes.
 - If you don't want to change this threshold, press ↵ (**PRINT**) and skip to step 8.
 - If you do want to change it, proceed to step 7.
7. Enter a new threshold value. To do this, press ↑ (**P.TARE**) to change the current digit, then ➔ (**TARE**) to move to the next digit. When you are done, press ↵ (**PRINT**).
8. The threshold values are saved in EEPROM memory.

8.3 Using the Tilt Switch

You can set the time delay for the tilt switch function using the setup parameter **4.t**. Use this parameter to enter the time delay for display lock in 1/10 seconds.

When the contacts close, the display locks after the time delay elapses. When they open again, the display unlocks after the same time delay elapses.

Set **4.t** to **00** to disable the tilt function.

9 Communication With External Devices

9.1 Serial Ports Configuration

VT200/220 has two serial ports, designated port 1 and port 2. Port 1 is an RS232C port. Port 2 is an optional port installed on order, and can be either RS232C or RS485.

9.1.1 RS232C Serial Port

The port is used to connect to serial printers or personal computers.

9.2 Setting Port Output

9.2.1 Setting Port 1 Output

You can use setup parameter **2.t** to determine the output for port 1. The parameter accepts the following values:

- 00 – port disabled.

- 09 – print on demand. See chapter 9.3.2.
- 13 – transmit alibi memory. See chapter 9.3.4.

9.2.2 Setting Port 2 Output

You can use setup parameter **3.t** to determine the output for port 2. The parameter accepts the following values:

- 00 – port disabled.
- 01 – continuous weight output. See chapter 9.3.1.
- 02 – EDP protocol output. See chapter 0.
- 03 – printing data from local printer on remote printer. See chapter 9.3.6.

This option can be programmed by setting setup parameter **3.t** to 06. The weight indication of each scale is transmitted continuously along with its current tare and gross weight. The format is:

P+123.45N010.00(T/P)133.45G

Where the characters indicate:

- N for Net weight.
- G for Gross weight.
- T for the Tare weight when the scale was manually tared, or P for the tare weight when the tare was preset either from the device or from a PC.

Data Block Composition

Byte	Name	Description
1	Weight status	Bit 0: 0=Normal 1=No weight display Bit 1: 0=Gross 1=Net Bit 2: 0=No Auto zero 1=Auto zero Bit 3: 0=Within range 1=Out of range Bit 4: 0=No standstill 1=Standstill Bit 5: 0=Normal 1=Under minimum weighing range Bit 6: Must be always set to 1 Bit 7: Zero or parity
2	Polarity	"+" or "-".
3-8	Net weight	6 digits, including decimal point if any.
9	"N"	Indicates that the preceding weight is net.
10-15	Net weight	6 digits, including decimal point if any.
16	"T" or "P"	"T" specifies that the preceding weight is a manual tare. "P" specifies that the preceding weight is a preset tare.
17-22	Gross weight	6 digits, including decimal point if any.
23	"G"	Indicates that the preceding weight is gross.
24	Sync	Carriage return (0D hex) for end of transmission.

When Display Indication is Not Weight

When the indicator displays something other than weight, the data string to COM2 will be as follows:

```
|A|XXXX|TARE VALUE|T/P|GROSS VALUE|G|CR
```

"XXXX" in the format above will either be blank spaces, an error message, or the menu currently accessed by the user.

9.3.3 Print on Demand

Works With Ports

Port 1 (RS232).

Description

Weight data is transmitted every time a character is received from a connected peripheral. The demand character is programmed in setup **3.t.**, e.g. "1" 49d or 31 hex.

9.3.4 Alibi Transmit

Works With Ports

Port 1 (RS232).

Description

Transmits alibi serial number and gross weight for each transaction, when the **PRINT** key is pressed. The record is transmitted in the following format:

```
SN 1234 012340 kgG
```

9.3.5 EDP Protocol Output

Works With Ports

Port 2 (RS232 or RS485).

Description

Transmits weight measurements to a host computer, according to the currently-selected print format, with or without an ENQ prompt, and with or without an ACK/NAK handshake (see 'Setup Options' below).

The EDP protocol works when more than one indicator is connected to the host PC. It is also more flexible than Print on Demand, allowing for more complex operations. It can also transmit more than just the weight measurement shown on the display, because it sends data according to the currently-selected print format.

Full Protocol Workflow

1. Within 5 seconds of initialization, the PC requests data by sending an ENQ (05 h) command. If it doesn't send an ENQ, the indicator shows Error 30 (host not ready).
2. After the **PRINT** () button is pressed, the indicator transmits weight information according to the currently-selected print format, using the standard data block composition (shown below).
3. Within 5 seconds of transmission, the PC either:
 - Acknowledges receiving the data properly, by sending an ACK (06 h) command.
 - Notifies the indicator the data was not properly received, by sending a NAK (15 h) command.

- Does not respond, in which case the indicator shows error 33 (host does not acknowledge).
4. If the host responded with a NAK command, steps 3 and 4 are repeated. The number of repeats is unlimited.

Relevant Setup Parameters

- **3.1** – timeout control. 0=No; 1=Yes. Turning off timeout removes the 5-second constraint in workflow steps 2 and 4. Errors 30 or 33 are never shown.
- **3.2** – handshake. 0=No; 1=Yes. Turning off handshake removes steps 4 and 5 of the protocol workflow - the indicator sends data blocks on demand, without waiting for a response.
- **3.3** – operator disable. 0=No; 1=Yes. If this option is turned on, an indicator may interrupt the protocol by pressing any key on the indicator keypad.
- **3.4** – host enquiry. 0=No; 1=Yes. Turning off host enquiry specifies that the indicator should send weight information continuously, not on demand.

Data Block Composition

Character/s	Description
STX (02 h)	Start of transmission.
ASCII (any)	ASCII data identical to the data printed.
ETX (03 h)	End of transmission.
BCC	Block check character (XORSUM of all data characters STX, ETX inclusive).

9.3.6 Remote Printer Output

Works With Ports

Port 2 (RS232 or RS485)

Description

Used to transmit the data printed on the local printer to a remote printer. No handshake is required.

10 Errors and Troubleshooting

When an error or an unexpected event occurs, the indicator displays the message **Err xx**, where xx is the error code. The following table explains all the error codes and suggests what to do when each error message is displayed.
